                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                          The present sequence is the protein sequence of human type II transmembrane serine protease 1 (MTSP1). The invention relates to novel human type II transmembrane serine protein 20 (MTSP20) (see ABP72374) and nucleic acids encoding it (see ABZ58499). Also claimed are methods of inhibiting tumour initiation, growth or progression by inhibiting MTSP20 activity, and of treating or preventing a disease or disorder associated with undesired and/or uncontrolled angiogenesis or neovascularisation, especially undesired angiogenesis associated with solid neoplasms, vascular malformations and cardiovascular disorders, chronic inflammatory diseases, aberrant wound repairs, circulatory disorders, crest syndromes, dermatological disorders and ocular disorders using an inhibitor of MSP20
                                                                                                                                                                                                                                        New type-II membrane-type serine protease 20 polypeptides, useful for preparing a medicament for diagnosing, treating or preventing cancer, dermatological disorders, aberrant wound repairs or crest syndromes.

The invention relates to human type I transmembrane serine protease 25 (MTSP25; ADB97565) and polypeptides derived from it (e.g., ADB97555). The CC (MTSP25 gene is located on chromosome 12 MTSP25 is a serine protease CC which is activated by protease cleavage to yield a two-chain protease CC comprising an A chain and a B chain linked by a disulphide bond. MTSP25 (C comprising an A chain and a B chain linked by a disulphide bond. MTSP25 (C is expressed or is active in tumour cells, and can therefore be used as a CC diagnostic marker for certain cancers. The invention also encompasses (C nucleic acids encoding an MTSP25 polypeptide (ADB9754); nucleic acid vectors and host cells comprising an MTSP25 (C ADB9754); nucleic acid vectors and host cells comprising an MTSP25 (C EDB97554); nucleic acid vectors and host cells comprising an MTSP25 (C C ADB97554); nucleic acid vectors and host cells comprising an MTSP25 (C C Ether the single chain (zymogen) or two-chain (activated) form of C c either the single chain (zymogen) or two-chain (activated) form of C C treating neoplastic diseases, such as cancer of the breast, cervix, C C prostate, lung, ovary or colon. MTSP25 polypeptides may also be used for cidentifying compounds that modulate the protease activity of the c polypeptide and for monitoring tumour progression and/or therapeutic c effectiveness. The present sequence represents the related protein, MTSP1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New purified single- or two-chain polypeptide, useful for diagnosing, preventing or treating cancer (e.g. colon cancer), comprises a protease domain of a type-1 membrane-type serine protease 25 or its catalytically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  08-OCT-2002; 2002WO-US032417
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens

X444X8X2222222222222XXX Novel conjugate useful for treating cell-surface protease-associated disease, comprises a therapeutic agent and a peptidic or nucleic acis substrate linked to it optionally by a peptidic linker.

9; SEQ ID NO 2; 581pp; English

The invention comprises a conjugate that consists of a therapeutic agent and a peptide substrate (optionally linked via linker). The peptide substrate is proteolytically cleaved by a cell surface protease pr a soluble, released or shed form of it, to liberate the therapeutic agent, the conjugate of the invention is not substrantially cleaved by plasmin or protease specific antigen (PSA). The conjugate of the invention is useful for treating a cell-surface protease-associated disease such as: cancer, ocular diseases, cardiovascular diseases, chronic inflammatory diseases, wounds, circulatory disorders, dermatological disorders, rheumatoid arthritis, psoriasis, diabetic retinopathies, recurrence of pterygium, scarring from excimer laser surgery, scarring from glaucoma filtering surgery, macular degeneration, crest syndromes, solid neoplasms, vascular tumours, melanoma and Kaposi's sarcoma. The present amino acid sequence represents a human cell surface protease.

This sequence represents a human type II membrane-type serine protease 1 (MTSP1). The MTSP1 protein sequence was used in the isolation of the CC coding sequence of MTSP12, which has been isolated to chromosome 19. CC MTSP12 does not include the sequence of amino acids Arg-Lys-His-Leu-Pro-CC Arg-Pro-Ala ADG65347. The MTSP12 coding sequence was identified by using CC the protein sequence of the protease domain of MTSP1 to search the human CC HTGS database which produced three serine proteases of MTSP12-PD1, MTSP12-PD3. EST's were identified which matched portions of CC MTSP12-PD1, MTSP12-PD2 and MTSP12-PD3. MTSP12-PD3. MTSP12-PD3. EST's were identified which matched portions of CC cncers. These are useful in diagnostics, particularly for diagnosing CC cancers. These are useful in immunoassays to detect, prognose, diagnose, CC concers. These are useful in immunoassays to detect, prognose, diagnose, CC concers. These are useful in immunoassays to detect, prognose, diagnose, CC concers. These are useful in immunoassays to detect, prognose, diagnose, CC concers. These are useful in immunoassays to detect, prognose, diagnose, CC concers. In an example from the invention, the protein sequence of the protease domain of MTSP1 was used to search a human genome database. A protease was identified and designated serine protease 16 or CVSP16. CVSP16 CDNA ADI28863 was subsequently cloned from a human liver cDNA library by PCR. CVSP16 polypeptides exhibit protease activity as a single chain or as a multi-chain form. Methods are provided for identifying compounds that modulate the protease activity. CVSP16 polypeptides also
                                                                                                                                                                                                                                                                                                                                                                                                               treating can

CC The invention relates to a conjugate comprising a therapeutic agent and a CC peptidic substrate or nucleic acid substrate linked to the agent CC optionally through a linker or peptidic linker, where the peptidic CC substrate is proteolytically cleaved by a cell surface protease or a CC soluble, released or shed form conjugate to liberate the agent and the CC conjugate is not substantially cleaved by plasmin or prostate specific CC antigen (PSA). The conjugate is useful for treating a disease, which CC involves administering a conjugate to a subject, where the disease is CC preferably a proliferative diseases or a cell-surface protease-associated CC disease. The diseases include autoimmune diseases, inflammatory diseases, infectious diseases and endocrine diseases. The conjugate is useful for treating a conjugate comprising an agent and a peptidic substrate to confident and conjugate comprising an agent and a peptidic substrate to a subject exhibiting symptoms of a cell-surface protease-associated CC disorder, where the disease is selected from cancer, ocular disorders, cardiovascular disorders, chronic inflammatory diseases, wounds, CC circulatory disorders, dermatological disorders, restenosis, rheumatoid CC cardiovascular disorders, dermatological disorders, restenosis, rheumatoid CC cardiovascular toom glaucoma filtering surgery, macular degeneration, CC conjugate toom and Kaposi's sarcoma. This sequence represents a transmembrane CC serine protease (MTSP) polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

The invention relates to novel genes that are differentially expressed in sub-types of renal cell carcinomas and methods of detecting them using nucleic acids and probes. The nucleic acid probes hybridize with part or all of a coding sequence that is overexpressed in clear cell renal cell carcinoma (CC-RCC), papillary RCC, chromophobe/oncocytoma RCC,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        comparison to a baseline value. The methods and compositions of the present invention are useful in the field of molecular biology and medicine, in particular for gene expression profiling of certain types kidney cancer, in identifying diagnostic markers, and treating such cancer patients. This sequence corresponds to the protein encoded by a gene with increased expression in CC-RCC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             sarcomatoid RCC,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Local

sapiens

Isolated human polynucleotides encoding polypeptides, useful for treatment and diagnosis of e.g. cancer, ulcers and HIV infection.

20; Page 237; 1217pp; English.

CC AAH99166 to AAH99904 encode the human proteins given in AAM2525 to CC AAW25963. The proteins can have activities based on the tissues and cells they are expressed in, such as: antiinflammatory; antirheumatic; CC entral nervous system; virucide; antiinflammatory; antirheumatic; CC candiovascular; antianaemic; antiaggregant; haemostatic; universary; CC antiulcer; osteopathic; dermatological; antiallergic; antiasthmatic; CC antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; CC antidiabetic; cytostatic; neuroprotective; antidepressant; nootropic; CC antiparkinsonian; and immunostimulant. The proteins and polynucleotides cencoding them can be used in gene therapy, antisense therapy and vaccine cytostation. The proteins and polynucleotides composits or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, CC neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal contents, autoimmunity, genetic diseases, haematopoietic disorders, cardiac anaphylaxis, viral, bacterial, HIV and fungal contents, platelet disorders, thrombocytogaenia, wounds, burns, ulcers, CC antenna, platelet disorders, thrombocytogaenia, wounds, burns, ulcers, CC antenna, platelet disorders, thrombocytogaenia, wounds, burns, ulcers, CC antenna, diabetes, cancer, multiple sclerosis, depression, CC neuropathology, parkinson's disease, neurodegenerative and

Human proteins and DNA encoding sequences useful for preventing, treating or ameliorating a medical condition in a mammalian subject e.g. arthritis and cancer.

Claim 20; Page 188; 1963pp; English.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and convention also relates to vectors and recombinant host cells comprising a concludide of the invention, methods of producing the movel polypeptides, contibodies against the polypeptides, methods of identifying compounds which conditions the polypeptides, methods of identifying compounds which conditions are invention. Although novel, many of the cold bind to polypeptides of the invention have homology to known proteins, thereby conjupeptides of the invention have homology to known proteins, thereby conjupeptides of the invention have homology to known proteins, thereby conjupeptides of the invention have homology to known proteins, thereby contential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differential therapeutic applications. The polypeptides of the invention may commondulatory activity; activing the memoratic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be conditions are useful for preventing, treating or metastasis.

Conjuped in oncogenesis, cancer cell proliferation or metastasis.

Conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic acids encoding them) may be used to promote wound cancers in the conditions in addition to immune disorders.

Conditions of burns, inclsions and ulcers), while those with commondulatory activities may be used in the treatment of viral, conditions in addition to immune disorders.

For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human polypeptide of the invention
                                                                                                                             787
                                                                                                                                                                                                                                                                                                                                                                                                                                                 543
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           547

                                                                                                                                                                                                                                                                                                          sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore mormal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity responsible for genetic disorders or other traits to assess biodiversity
                                                                     and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBCELLULAR LOCATION: Type II membrane protein (Probable)
SIMILARITY: Belongs to peptidase family S1.
SIMILARITY: Contains 2 CUB domains.
SIMILARITY: Contains 4 LDL-receptor class A domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GO:0005887; C:integral to plasma membrane; GO:0008236; F:serine-type peptidase activit

Expression in the d liver as well as a restricted set of embrionic epithe the nasal cavity and pharyngo-tympanic tubes. SIMILARITY: Belongs to peptidase family S1. SIMILARITY: Contains 2 CUB domains. SIMILARITY: Contains 3 LDL-receptor class A domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            mbrane anchored serine proteases: a rapidly expanding group of face proteolytic enzymes with potential roles in cancer."; cer Metastasis Rev. 22:237-258(2003).
FUNCTION: May play a specialized role in matrix remodeling processes in liver (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein.
TISSUE SPECIFICITY: Expressed at highest levels in liver, kidn
